Merely no terms to spell out. We have read through and i also am confident that i will gonna read yet again again in the future. You will not sense monotony at anytime of your own time (that's what catalogs are for about should you question me).

Excerpt: . . . the lower part of the beam is drawn in broken lines. Let b breadth of the beam 5 d depth from top of beam to axis of reinforcement clear span between supports Sx distance between assumed diagonals 10 in. w load per inch of length 100 lb. 10 1n. 80 in. The load applied upon the top of the beam is practically equivalent, so far as concerns stress on the assumed diagonals, to downward vertical forces equal to wx, acting at eachof the points, av a2, a3, a4, and downward forces equal to wx, acting at the points a, a. The total tensile stresses along the diagonals may be ascertained by adding together the stresses due to the different weights, or by the simple rule, P, ---- 1 wSx sec 6 (45) Where Pe total tensile stress in any diagonal, N number of bays formed by assumed diagonals, n-numerical order of any bay from the abutment, 6 inclination of assumed diagonals. In this case the inclination of the diagonals to the horizontal is 45 deg. , and the value of sec 1. 41421, say 1. 414. The value of wSx 100 x 10 1, 000 lb. Calculating the tensile stresses in the diagonals for one half of the beam, we have. (8-2 X l) I. . a b4, Vt -x (1, ooo x 1. 414) 4, 949 lb. ;, 000 x 1. 414) 707 lb. Dividing each of these results by the area of the...
